

PUSA KRISHI INCUBATION PROGRAM 2026

100 Agricultural Problems You Can Solve to Win a Grant

A comprehensive idea bank for innovators, students and entrepreneurs

UPJA Up to Rs 25 Lakh

ARISE Up to Rs 5 Lakh

STUDENT Up to Rs 4 Lakh

Last Date to Apply: 17 May 2026 | FREE to apply at: pusakrishi.in

HOW TO USE THIS GUIDE

This document presents **100 real agricultural problems** across 10 categories. Each is a potential winning application for the **Pusa Krishi Incubation Program 2026**. Pick a problem that matches your skills, build a solution and apply before **17 May 2026**.

Step 1: Find a problem in this document that excites you.

Step 2: Download the official presentation template from pusakrishi.in.

Step 3: Fill in the template: Problem, Solution, MVP/Prototype, Market Size, Team, Ask.

Step 4: Rename your file as [CompanyName]_[UPJA/ARISE/STUDENT]2026.pptx

Step 5: Submit the form on pusakrishi.in — it is completely FREE.

Grant Tiers:

UPJA 2026 — Up to Rs 25 lakh | Registered startup + MVP required

ARISE 2026 — Up to Rs 5 lakh | Idea or prototype stage accepted

STUDENT 2026 — Up to Rs 4 lakh | No entity registration needed

Disclaimer: This idea bank is compiled to help innovators brainstorm. The problems and solution sketches are starting points — your unique implementation, team and market understanding will determine success. All grant details are as per publicly available programme guidelines. Apply directly on pusakrishi.in only.

#1 Soil Health Monitoring App

Farmers lack affordable real-time soil nutrient data. Build a low-cost IoT sensor or app-based advisory that maps N-P-K and pH for small landholdings and pushes crop-specific fertiliser recommendations in local languages.

#2 Micro-Irrigation Scheduler

Drip/sprinkler systems are installed but operated inefficiently. Create a sensor-driven scheduler that integrates weather forecasts, crop evapotranspiration rates and soil moisture to automate valve control via a basic feature phone.

#3 Hyper-Local Crop Calendar

Generic sowing calendars misfit local micro-climates. Build a block-level digital calendar using 10-year IMD data, satellite NDVI trends and district crop records to recommend variety-specific sow-harvest windows.

#4 Seed Adulteration Detection Kit

Spurious seeds cause huge yield losses. Develop a low-cost paper-strip or smartphone-based kit that detects common adulterants or performs germination-rate fingerprinting so farmers verify quality before sowing.

#5 Precision Fertiliser Drone Spraying

Blanket fertiliser application wastes inputs. Build an affordable UAV that reads crop colour and applies variable-rate fertiliser only where the canopy signals deficiency, reducing input cost by 30%.

#6 AI-Based Weed Identification

Mis-identification of weeds leads to wrong herbicide use. Develop a smartphone camera model that identifies 50+ common weeds and recommends the correct herbicide, dose and timing in Hindi or regional languages.

#7 Inter-Cropping Advisor

Farmers lack knowledge of profitable inter-crop combinations. Create a decision-support tool that uses soil type, water availability and market prices to recommend and schedule inter-crop combinations.

#8 Real-Time Crop Stress Alert

Nutrient or water stress is detected too late. Build a drone/satellite image subscription service that flags stress zones on a farmer's plot weekly and links to extension worker for on-ground validation.

#9 Crop Residue Valorisation System

Paddy-straw burning is the default. Develop a collection-and-conversion model (briquettes, biochar, or fodder pre-processing) that makes residue management financially attractive compared with burning.

#10 Automated Transplanting Machine (Small-Scale)

Manual transplanting of paddy/vegetables is labour-intensive. Engineer a low-cost 2-row transplanter that fits 1-2 BHP walk-behind tractors used by marginal farmers.

#11 Zero-Energy Cool Chamber 2.0

Brick-and-sand ZECCs work but are not scaled. Build a standardised flat-pack kit version with phase-change material panels that can be assembled in 4 hours and extends perishable shelf-life by 5-7 days.

#12 Real-Time Cold-Chain Monitoring

Temperature excursions in cold trucks go undetected. Build a Rs 500 IoT tag (NB-IoT/BLE) that logs temperature, alerts buyers on breach, and creates a tamper-proof ledger for insurance claims.

#13 AI-Powered Grade Sorting Machine

Manual grading is slow and inconsistent. Develop a conveyor-belt image-recognition system using Raspberry Pi and camera that auto-sorts fruits and vegetables by size, colour and surface defects.

#14 Aggregation Platform for FPOs

Farmer producer organisations struggle to plan shared logistics. Build a lightweight SaaS that aggregates harvest schedules, matches produce lots to mandis and optimises truck loads to reduce empty-vehicle runs.

#15 Grain Moisture & Mould Sensor

Grain stored above 14% moisture develops aflatoxin. Build a handheld probe that measures moisture and CO₂ (mould proxy) in grain bags, records GPS readings and warns farmers before storage losses mount.

#16 Last-Mile Cold Chain for Tribal Areas

Tribal and hilly regions lack electricity for cold storage. Design a solar-DC cold box (2-5 crates, 8-10 degrees C) mountable on e-bikes for same-day vegetable delivery to the nearest town market.

#17 Crop Price Forecasting Tool

Farmers sell at harvest-time low prices. Build an ML model trained on AGMARK arrivals, weather and export data to give 30-day price forecasts per commodity-mandi pair, available via SMS or IVR.

#18 Direct-to-Consumer Perishable App

Middlemen capture 40-60% of vegetable value. Build a hyper-local app where farmers list same-day harvest and urban buyers within 25 km get 2-hour delivery, with WhatsApp-based orders for non-smartphone farmers.

#19 Packaging Innovation for Rural Produce

Non-standardised packaging increases damage in transit. Develop biodegradable stackable crate inserts sized for common Indian vegetables that reduce bruise damage by 50%.

#20 Blockchain Traceability for Export Produce

Indian exporters face rejections for pesticide residue without clear audit trails. Build a farm-to-port blockchain module that records input usage, harvest date and test results integrated with APEDA systems.

#21 Offline-First Farmer App

Connectivity gaps make urban-designed apps useless in villages. Build a Progressive Web App that works fully offline, syncs data on any network and supports voice-in/voice-out navigation in 5 Indian languages.

#22 AI Crop Disease Diagnosis via WhatsApp

Farmers already use WhatsApp. Build a chatbot that accepts a crop photo, returns a disease or pest diagnosis, severity rating and treatment protocol in the farmer's language — no app install needed.

#23 Satellite-Derived Parametric Crop Insurance

PMFBY claims are slow and opaque. Build a parametric index using Sentinel-2 NDVI time-series that auto-triggers pay-outs when a farmer's plot dips below area-average yield proxy — cutting claim settlement to 48 hours.

#24 Farmer Financial Profiling Tool

Banks lack data to lend to small farmers. Build a credit-scoring model using satellite crop history, Kisan Credit Card repayment and mandi transaction data to generate a FarmScore accepted by regional rural banks.

#25 IoT Weather Station for Rs 2,000

Private automatic weather stations are too expensive. Design a Rs 2,000 solar-powered micro-weather station with 2G/LoRa uplink that villages can self-install, feeding a shared dashboard for 5 km radius advisories.

#26 Digital Land Record Integration API

Multiple government schemes require land records manually. Build an API layer on state Bhu-Naksha/DILRMP data that auto-populates scheme forms, reducing rejection due to record mismatch from 35% to near zero.

#27 Agri E-Commerce for Inputs (Rural-First UX)

Existing input e-commerce UX is designed for urban users. Build a voice and image search interface where a farmer describes or photographs a pest or need and the platform recommends and delivers approved inputs to the village.

#28 Drones-as-a-Service Platform

Individual drone ownership is uneconomical for smallholders. Build a marketplace that lets drone pilots register their UAV and farmers book spraying slots with auto-payment on completion, GPS flight logs as proof.

#29 Data Marketplace for Agri-Research

Research institutions lack granular farm data. Build a privacy-preserving data exchange where farmers monetise anonymised yield, input and practice data, earning digital vouchers redeemable for inputs or insurance premium credits.

#30 Extension Worker Digital Toolkit

Krishi Vigyan Kendra agents still use paper. Build a tablet/mobile offline toolkit that lets extension workers record field visits, generate auto-advisory reports and sync with block-level dashboards for programme monitoring.

#31 Groundwater Depletion Early Warning

Over-extraction for irrigation is invisible until wells fail. Build a network of low-cost groundwater-level sensors that send data to a block-level dashboard and trigger SMS alerts to panchayat heads.

#32 Canal Water Allocation App

Canal distribution is inequitable and opaque. Build an app for irrigation departments to publish daily release schedules, let farmers track flow in real time and file complaints about unauthorised diversion.

#33 Drought Resilience Crop Advisory

Farmers in rain-shadow areas have no tailored guidance. Build a decision tool that uses 30-year rainfall probability curves per block to recommend drought-tolerant variety portfolios and staggered sowing dates.

#34 Farm Pond Feasibility Planner

Govt farm pond subsidies are underutilised due to siting ignorance. Build a GIS tool that uses topography, soil permeability and rainfall to identify optimal pond sites and auto-generates DPR templates.

#35 Flood Early Warning for Farmland

River flooding destroys crops that could be partially harvested early. Build a farmer-facing flood alert system using CWC gauge data and upstream rainfall that gives 24-48 hour advance notice at village level via IVR.

#36 Carbon Credit Platform for Farmers

Voluntary carbon markets are inaccessible to smallholders. Build an MRV protocol app for zero-tillage and SRI practices that aggregates carbon credits from 500+ small farmers for sale to corporate buyers.

#37 Agrivoltaics Design Tool

Solar plus farming land-use synergy is poorly understood. Build a simulation tool that calculates crop-yield impact versus solar income for different panel-height and row-spacing configurations optimised for Indian radiation zones.

#38 Community Seed Bank Management System

Village seed banks are poorly catalogued and decay. Build a low-cost RFID-tagging and offline tablet system that helps seed bank custodians track seed age, germination rates and distribution with regeneration alerts.

#39 Plastic Mulch Recovery Solution

Plastic mulch film fragments left in soil accumulate over years. Develop a low-cost mechanical mulch-lifter attachment for small tractors that aggregates spent film for recycler collection, reducing soil microplastic load.

#40 Precision Fertigation Controller

Fertigation is often done by guesswork. Build a flow-meter and EC/pH sensor controller (sub-Rs 5,000 installed) that auto-doses fertiliser into drip lines according to crop growth stage schedules.

#41 AI Livestock Disease Surveillance

FMD and PPR outbreaks spread before detection. Build a community-surveillance app where village animal health workers photograph symptoms, an AI flags likely disease and triggers government vet notification within 2 hours.

#42 Dairy Milk Quality Tester (Low Cost)

Milk adulteration with water, urea and detergent is rampant. Develop a Rs 1,500 handheld colorimetric tester that detects 5 common adulterants in under 2 minutes, usable by SHG milk collectors at the doorstep.

#43 Estrus Detection Wearable for Cattle

Missed heat cycles reduce dairy farm productivity. Build a neck-mounted accelerometer tag that detects restlessness patterns indicating estrus and pushes an SMS/WhatsApp alert to the farmer 6-12 hours in advance.

#44 Poultry Farm Microclimate Controller

Heat stress in summer causes high poultry mortality. Build a Rs 8,000 PLC and sensor kit that automatically controls fans, foggers and feed-line motors to maintain optimal temperature-humidity index in 500-bird sheds.

#45 Goat & Sheep Traceability Platform

Small ruminant markets lack traceability, enabling disease spread. Build a cheap RFID ear-tag and mobile reader solution that records animal movement between mandis, linked to vaccination history for disease-outbreak backtracking.

#46 Aquaculture Water Quality Monitor

Pond dissolved-oxygen crashes kill fish overnight. Build a solar-powered DO and ammonia sensor buoy with night-time SMS alert that triggers emergency aeration, affordable for 1-acre pond operators.

#47 Fish Market Price Aggregator

Fishermen sell at landing price without knowing best nearby market. Build a daily price aggregator from 50+ fish landing centres and mandis delivered via IVR/WhatsApp so fishermen choose the best-priced landing point.

#48 Biofloc Technology Starter Kit

Biofloc fish farming boosts productivity but has a steep learning curve. Develop a guided starter kit with inputs and instructional videos with a remote monitoring app, enabling new fish farmers to set up their first unit safely.

#49 Backyard Poultry Feed Optimizer

SHG backyard poultry is fed kitchen scraps inefficiently. Build a ration-balancing mobile app using locally available ingredients that calculates the cheapest feed mix meeting layer-hen nutrient requirements.

#50 Veterinary Telemedicine Platform

Rural areas have fewer than 1 govt vet per 5,000 livestock. Build a teleconsultation platform where farmers submit video of a sick animal, a registered vet diagnoses and e-prescribes within 4 hours, with medicine doorstep delivery.

#51 PM-KISAN Grievance Resolution Tool

Millions of PM-KISAN beneficiaries face payment failures due to Aadhaar-bank seeding errors. Build an automated grievance-filing portal integrated with PFMS that guides farmers through correction steps in under 10 minutes.

#52 Crop Loan Repayment Forecaster

Banks fail to predict which loans will turn NPA. Build an early warning model using satellite crop health and local weather stress index that flags at-risk borrowers 60 days before due date for proactive restructuring.

#53 Micro-Insurance for Weather Extremes

Small farmers cannot afford PMFBY premiums. Design a micro-premium (Rs 200 per season) parametric product backed by IMD gridded rainfall data that pays out automatically on 5+ consecutive rainless days during kharif.

#54 Input Subsidy DBT Tracker

Fertiliser and seed subsidy leakages cost the exchequer billions. Build a retailer-point PoS system with farmer biometric verification and real-time DBT reconciliation that reduces ghost-beneficiary fraud.

#55 Women Farmer Land Rights Navigator

Women farmers often lack title deed and thus cannot access credit. Build a legal-aid chatbot that guides women through joint land titling, mutation process and links to NGO support, covering 5 major states revenue laws.

#56 FPO Accounting and Compliance SaaS

Most FPOs lack basic accounting software and miss MCA annual filing deadlines. Build a zero-cost SaaS for FPO secretaries to do bookkeeping, member ledgers and file ROC returns without CA dependency.

#57 Commodity Futures Education Platform

Farmers do not use NCDEX/MCX to hedge price risk. Build a vernacular simulation platform where farmers practise hedging using real historical price data, gamified to build intuition before committing real money.

#58 Agri MSME Working Capital Optimizer

Agri-processing MSMEs face seasonal cash crunches. Build a working capital advisory tool that uses input procurement and sales cycle data to recommend invoice-discounting, CC limits and seasonal term-loan mix.

#59 Organic Certification Fast-Track Platform

PGS-India organic certification is slow and paperwork-heavy. Build a digital platform that automates field inspection scheduling, peer-certification records and certificate generation, cutting time from 18 months to 6 months.

#60 Agri Export Compliance Checker

FSSAI/APEDA export documentation errors cause shipment rejections. Build a checklist and auto-fill tool that reads a buyer purchase order and generates compliant phytosanitary, fumigation and certificate of origin forms.

#61 Solar Dryer for Spices and Vegetables

Traditional sun-drying contaminates and loses colour. Design an affordable forced-convection solar tunnel dryer (10 kg per batch) using locally sourced materials that achieves food-safe moisture levels 60% faster than open drying.

#62 Community Biogas Plant Design Tool

Village biogas plants often under-perform due to poor sizing. Build a digital calculator that inputs cattle-head count, kitchen waste and toilet waste to size a biogas plant and auto-generate MNRE subsidy DPR.

#63 Millets Processing Micro-Unit

Millet demand is rising but village-level dehulling is unavailable. Develop a modular solar-powered millet dehulling and flour unit for SHGs that processes 50 kg/hour and meets FSSAI hygiene standards for direct retail.

#64 Cold-Pressed Oil Expeller for SHGs

Mustard and groundnut farmers sell raw oilseed at low prices. Design a Rs 50,000 electric expeller with basic filter press that lets SHGs produce and brand cold-pressed oil for urban premium markets.

#65 Pickle and Preserve Quality Standardisation Kit

Cottage-industry pickles fail shelf-life and salt/acid labelling tests. Build a simple titration and refractometer kit with a protocol guide that helps SHG units self-test and achieve consistent FSSAI-compliant specifications.

#66 Mushroom Spawn Production Unit

Oyster mushroom growers depend on city-based spawn suppliers. Develop a low-cost grain-spawn production kit (steriliser and inoculation box) with contamination-prevention protocol enabling village-level spawn self-sufficiency.

#67 Areca Leaf Plate Manufacturing Unit

Areca sheaths are burnt as waste. Build a hand-operated hydraulic press and die set costing under Rs 30,000 that converts areca sheaths into export-quality biodegradable plates and bowls.

#68 Hygienic Jaggery Processing Unit

Traditional jaggery contains high impurities, limiting export. Design a clarification and moulding unit for 5-tonne/day capacity that meets FSSAI microbiological standards and enables GI-tagged jaggery branding.

#69 Rural Bakery Standardisation Package

Village bakers lack consistent recipes and packaging. Build a business-in-a-box kit for bread/biscuit bakers with standardised recipes, weight-checker, FSSAI label template and an order-management WhatsApp bot.

#70 Turmeric and Spice Value-Addition Cluster

Raw turmeric sells at Rs 80-120 per kg while curcumin extract fetches Rs 800+. Design a cooperative-scale curcumin extraction unit and a direct-to-Ayurveda company linkage model for tribal turmeric growers.

#71 Gamified Agri Learning App for Rural Youth

Agricultural knowledge is not engaging for the next generation. Build a game-based mobile app where players manage a virtual farm, face real weather and pest scenarios and learn best practices with a quiz-to-cash prize loop.

#72 Chatbot for Government Agri Scheme Discovery

Farmers don't know which of 150+ central/state schemes they qualify for. Build a WhatsApp chatbot that asks 8 questions (landholding, state, crop, gender, income) and returns a personalised list of eligible schemes with application links.

#73 Drone Delivery for Remote Farm Inputs

Road connectivity to hilly villages is seasonal. Prototype a 5 kg payload autonomous drone delivery system for delivering seeds and medicines to farms unreachable in the monsoon, using open-source ArduPilot.

#74 Portable Soil Lab in a Backpack

Soil labs are 50-100 km away for most farmers. Build a student-designed portable kit with colorimetric reagents for N, P, K, pH and EC that a school student can carry on a bicycle to 10 farms per day.

#75 Bio-Pesticide Formulation Kit

Neem-based bio-pesticides are poorly formulated by cottage producers. Develop and validate a standardised emulsifiable-concentrate preparation protocol using locally sourced neem seed kernel extract, tested for efficacy against 3 common pests.

#76 Smart Vermicompost Bin with IoT Monitor

Vermicomposting fails due to temperature and moisture neglect. Build a low-cost IoT bin (DHT22 + moisture sensor + ESP32) that monitors conditions, alerts the farmer via WhatsApp and logs data for research on optimisation.

#77 Agri Waste to Art and Craft Products

Crop stubble, banana fibre and coconut shell are discarded. Develop a product line from agri-waste with a student-run e-commerce brand on Etsy or Amazon, demonstrating circular economy at micro scale.

#78 Aquaponics Unit for School Campuses

Schools lack live examples of sustainable food systems. Design a low-cost water-efficient aquaponics system (50-litre fish tank + NFT grow bed) that schools assemble from locally available materials and run as a learning lab.

#79 AI-Based Mandi Arrival Prediction

Mandi prices crash on peak arrival days. Build an ML model using historical AGMARKNET arrival data, festival calendars and weather to predict weekly arrival surges per commodity-mandi, helping farmers time their sales.

#80 Plant Health Monitoring Through Leaves (Edge AI)

Smartphones are now powerful enough to run lightweight models. Train a TFLite model on 10,000+ labelled leaf images to identify 20 diseases and deficiencies that runs fully offline, deployed as a free Android app.

#81 Village-Level Agri Service Centre Platform

Custom hiring centres exist but are hard to locate. Build an app where farmers search and book tractors, threshers, harvesters and cold vans within 20 km, with digital payment and GPS-tracked delivery.

#82 Women SHG Digital Order Book

SHG produce orders are managed in error-prone paper notebooks. Build a WhatsApp and Google Sheets bridge that lets SHG members record orders, generate delivery lists and compute profit-sharing in regional language.

#83 Agri Input Quality Complaint Portal

Fake pesticide and fertiliser retailers face no accountability. Build a geo-tagged complaint portal linked to state agriculture dept licensing databases, with automated retailer-suspension trigger after 3 verified complaints.

#84 Rural Logistics Network for FPOs

FPOs cannot compete on logistics cost with large traders. Develop an FPO consortium logistics model with shared refrigerated vehicle routes across 5-10 FPOs per district, managed by a digital dispatch platform.

#85 Farm Labour Marketplace

Paddy transplanting creates acute 3-day labour shortages at peak. Build a hyperlocal platform where farmers post seasonal work (date, location, wage, task) and migrant workers pre-book via USSD or missed-call system.

#86 Agri Waste Collection & Recycling Network

Used pesticide containers contaminate soil and water near farms. Design a deposit-refund system where retailers charge a deposit, farmers return empty containers and a recycler aggregates via scheduled village pickups.

#87 Rural Cold Storage Cooperative Model

Single-farmer cold stores are economically unviable. Design a 50-tonne cooperative cold store model (shared ownership, slot booking app) that a village or FPO can finance using NABARD RIDF grants, with a full business plan template.

#88 Disability-Inclusive Farm Tool Adaptations

Physically challenged farmers are excluded from mechanisation benefits. Design low-cost ergonomic adaptations for common tools such as the wheel hoe and sprayer, tested with 20 disabled farmers.

#89 Agri Tourism Experience Platform

Farms near tier-2 cities can generate agri-tourism revenue. Build a listing-and-booking platform for farm stays, harvest experiences and rural cooking workshops marketed to urban families seeking weekend getaways.

#90 Digital Mela (Farmer Fair) Platform

Physical kisan melas reach only local farmers. Build a virtual kisan mela platform with product exhibitions, government scheme booths and live Q&A; with scientists, accessible via basic smartphone in multiple languages.

#91 New Crop Variety Communication Tool

New stress-tolerant varieties reach farmers 10 years late due to awareness gaps. Build a multi-media content library (videos, infographics) that explains benefits in simple language, distributed via KVK WhatsApp channels.

#92 Precision Livestock Nutrition (AI Diet Planner)

Livestock rations in India are formulated by habit, not science. Build an AI diet planner that uses real fodder prices, animal weight and milk yield data to compute the cheapest nutritionally balanced ration daily.

#93 Hydroponics Vertical Farm for Urban Rooftops

City rooftops are unused while fresh vegetables travel 500 km. Design a modular NFT hydroponics kit (16 sq m footprint) for apartment buildings that produces 10 kg of leafy vegetables weekly with a subscription delivery model.

#94 Robotic Weeding System for Raised Beds

Herbicide resistance is growing. Prototype a rail-guided, camera-controlled mechanical weeder for vegetable raised beds (Rs 15,000 cost target) that uses OpenCV to distinguish crop row from inter-row and actuates a hoe blade.

#95 Insect Protein Farming for Poultry Feed

Soya is the dominant poultry protein and is costly and import-dependent. Build a black soldier fly larvae rearing system that converts restaurant food waste to poultry protein meal at under Rs 30 per kg, with a full logistics model.

#96 Remote Sensing Crop Yield Estimator

State crop-cut experiments are expensive and few. Build a free-to-use district-level yield estimator using Sentinel-2 LAI and MODIS ET data, validated against historical APY data, useful for insurance and planning departments.

#97 Nanotech Fertiliser Delivery System (Research Stage)

Conventional fertilisers have 30-40% uptake efficiency. At prototype level, develop a chitosan nano-capsule that slow-releases N-P-K at crop root zone, reducing application frequency and groundwater leaching.

#98 Voice-Based AI Agricultural Expert (IVR + LLM)

Most agri apps require literacy. Build a toll-free IVR system powered by a fine-tuned regional-language LLM that answers open-ended farming questions, logs knowledge gaps and escalates complex queries to human experts.

#99 Satellite-Driven Irrigation Advisory for Small Farmers

Small farmers need weekly irrigation decisions, not monthly reports. Build a free SMS service that uses Sentinel-2 NDWI and crop coefficient curves to send field-specific irrigation volume and timing advice every Monday.

#100 Integrated Pest Management (IPM) Digital Toolkit

IPM adoption is low because farmers don't trust it works. Build an evidence-based digital toolkit with pest forecasting based on temperature accumulation models, pheromone trap count logging and bio-agent sourcing directory covering 20 major crops.

READY TO APPLY?

Visit **pusakrishi.in** to download the official presentation template, review eligibility criteria and submit your application for free.

Stay updated via WhatsApp: <https://whatsapp.com/channel/0029VaTBvBo2ZjCmY32h931p>

Application Deadline: 17 May 2026, 11:59 PM

Good luck. India's agricultural future needs your innovation.
